

P25 — Create repo and push code

On GitHub website

1. Click + → New Repository
2. Name it → WAD_PRAC
3. Click Create Repository

In VS Code terminal

bash

go to your project folder

cd C:\Users\Lenovo\OneDrive\Desktop\WAD_PRAC

initialize git

git init

add all files

git add .

save with message

git commit -m "first commit"

connect to github repo

git remote add origin https://github.com/YOURUSERNAME/WAD_PRAC.git

push to github

git push -u origin main

P26 — push, pull, branch, merge

PUSH — send code to GitHub

bash

make a change in any file, then:

git add .

git commit -m "updated file"

git push

PULL — get latest code from GitHub

bash

git pull origin main

BRANCH — create separate version

bash

create new branch

git branch feature1

switch to that branch

```
git checkout feature1
```

```
# now make some changes to any file  
# then add and commit  
git add .  
git commit -m "changes in feature1 branch"
```

MERGE — combine branch into main

```
bash  
# first go back to main  
git checkout main  
  
# merge feature1 into main  
git merge feature1
```

All commands in one flow — show this to examiner

```
bash  
git init                # initialize  
git add .               # stage files  
git commit -m "first commit" # save  
git remote add origin URL # connect github  
git push -u origin main  # push to github  
  
git branch feature1     # create branch  
git checkout feature1   # switch branch  
git add .               # stage changes  
git commit -m "feature branch work" # commit  
git checkout main       # back to main  
git merge feature1      # merge  
git push                # push merged code  
git pull origin main    # pull latest
```

What each command means — examiner will ask!

Command	Meaning
git init	Start tracking this folder with git
git add .	Stage all changed files for commit
git commit -m "msg"	Save snapshot with a message
git remote add origin URL	Connect local repo to GitHub

<code>git push</code>	Upload commits to GitHub
<code>git pull</code>	Download latest code from GitHub
<code>git branch feature1</code>	Create new branch called feature1
<code>git checkout feature1</code>	Switch to feature1 branch
<code>git merge feature1</code>	Merge feature1 into current branch
<code>git status</code>	See which files are changed
<code>git log</code>	See list of all commits

Difference between P25 and P26

P25	P26
Create GitHub account	Already have account
<code>git init</code>	<code>git init</code>
<code>git add + git commit</code>	<code>git add + git commit</code>
<code>git push</code>	<code>git push + git pull</code>
—	<code>git branch + git merge</code>

P25 is **subset of P26** — if you know P26 you automatically know P25!

Quick diagram — branch and merge

main branch:

Branch = separate copy to work on Merge = bring changes back to main
